WEB230: JavaScript 1

Chapter 1: Addendum

Strings Escaping

- some special characters need a backslash
 - newline is "\n", tab is "\t"

"This is the first line\nAnd this is the second"

will result in:

This is the first line

And this is the second

• if you need to display a special character use "\"

"A newline character is written like \"\\n\"."

will result in:

A newline character is written like "\n".

Template Literals

- Backtick-quoted strings, usually called *template literals*, can do more than single or double quoted strings:
 - span lines
 - · embed other values

`Strings can now span lines`

• an expression inside \${} will be evaluated, converted to a string, and included at that position

```
let number = 100;
console.log(`half of ${number} is ${number / 2}`);
```

displays:

half of 100 is 50
